1. Introduction

Padeler is a desktop application designed to help padel players find suitable playing partners based on location, skill level, and personal preferences. The application combines geolocation services, filtering mechanisms, and a swipe-based interaction model to create an intuitive and engaging user experience.

This user manual provides a comprehensive overview of the application's functionality and guides users through all available features.

---

2. Application Startup and Help System

The application is started by launching the Padeler executable file. After startup, users are prompted to log in or register.

At any moment during application usage, the user can press the **F1 key** to open this user manual in PDF format. The help system is globally available and can be accessed from any screen within the application.

---

3. User Registration and Login

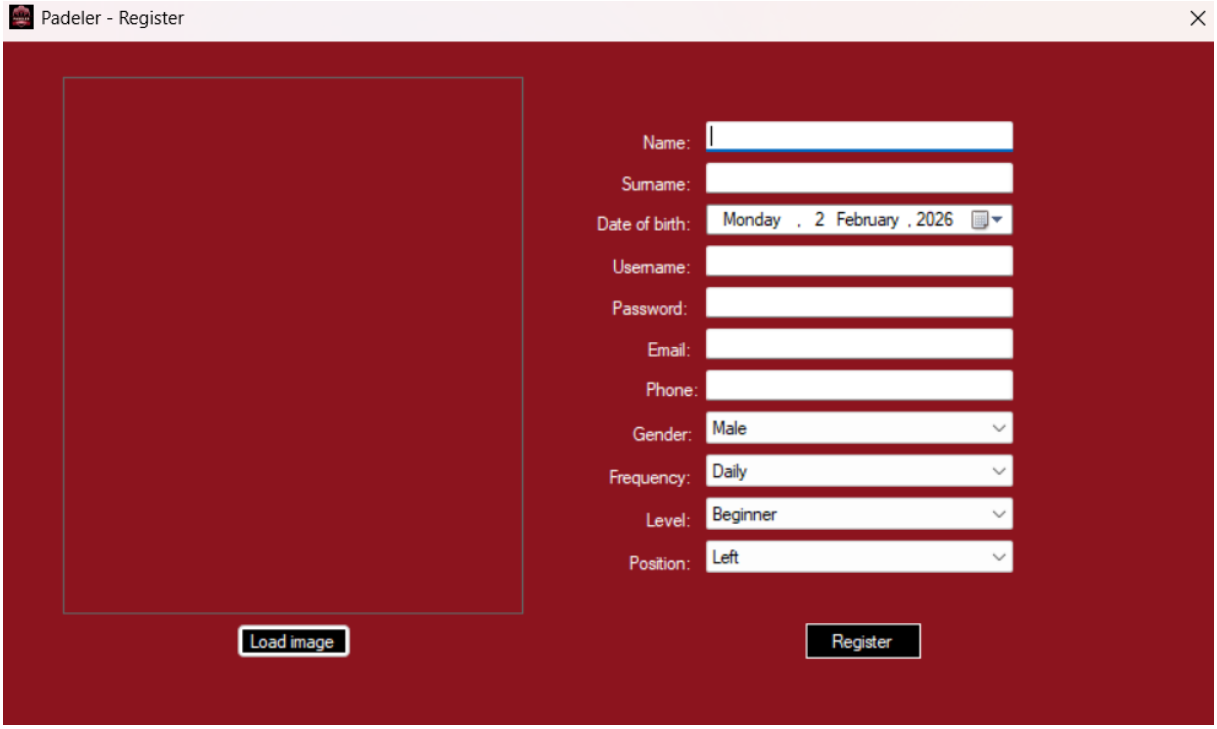
3.1 User Registration

New users must create an account before accessing the application's features. During registration, users are required to enter personal information and padel-related preferences.

Registration includes:

- Username and password
- Name and surname
- Gender
- Date of birth
- Playing level
- Preferred playing position
- Playing frequency
- Profile image upload (optional)

After successful registration, the user can log in using the created credentials.



3.2 User Login

Registered users can log in by entering their username and password. Upon successful authentication, the application loads the main interface.

If the user exits the application without logut (by pressing [x]), the application stores login information locally to simplify future logins.

---

4. Home Screen – User Cards

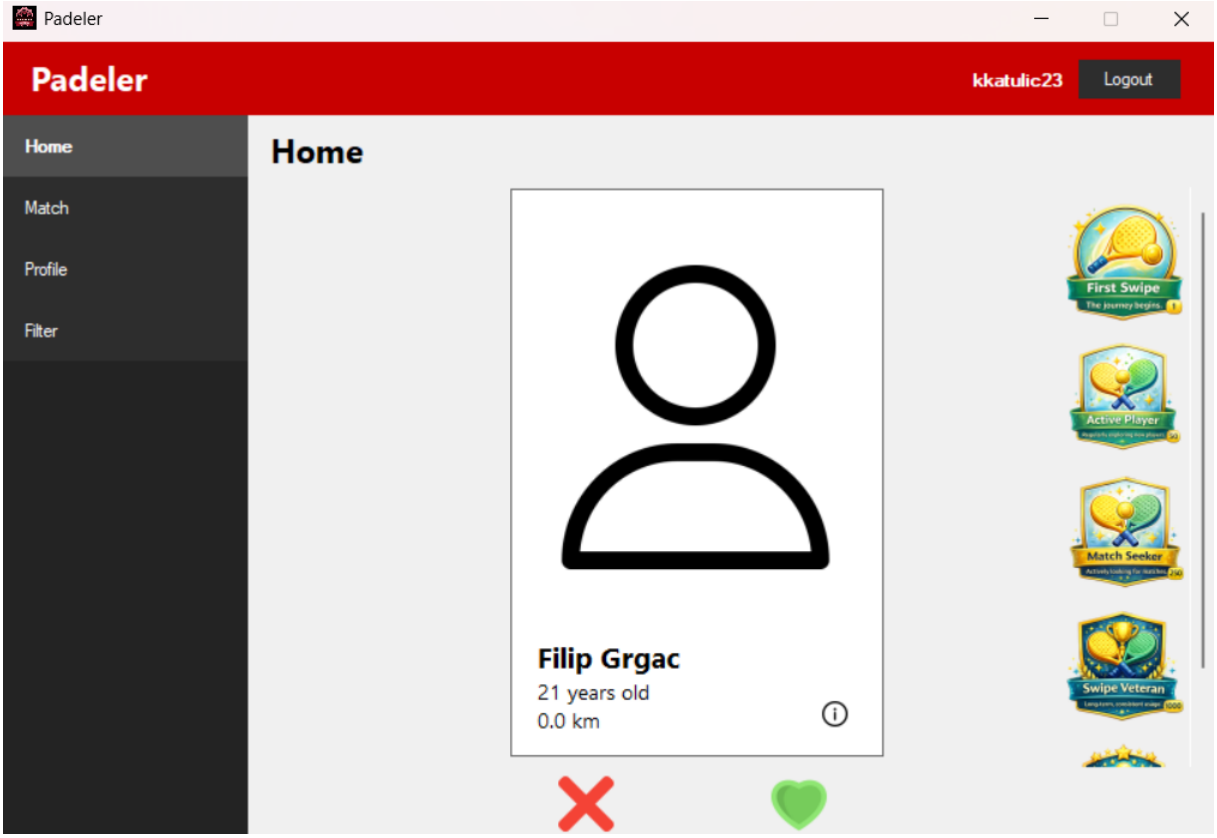
The Home screen displays user cards representing nearby padel players. These cards are generated based on the user's current location, selected radius, and applied filters.

Each user card contains:

- Full name
- Age
- Playing level
- Playing position
- Playing frequency
- Distance from the current user
- Profile image

Users can swipe through cards and choose to like or dislike other users. The interface is designed to be fast, intuitive, and visually clear.

The user presses heart emoji for like, and X for dislike.



---

5. Filtering Users

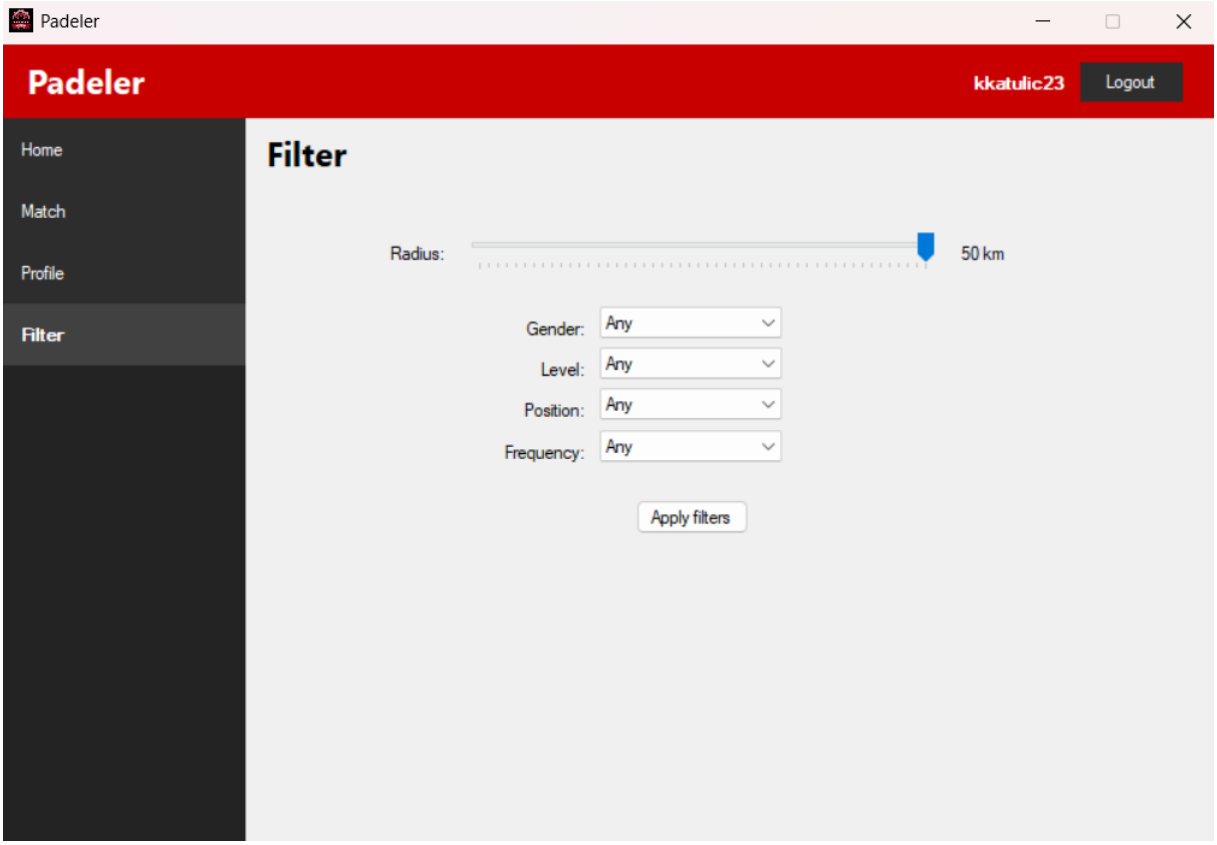
Padeler allows users to customize the list of displayed players through a dedicated filter form.

Available filters include:

- Search radius (in kilometers)
- Gender
- Playing level
- Playing position
- Playing frequency

Each filter can be set to **Any (**except location which has a default max setting of 50), meaning that the criterion will not restrict the search. Filters can be combined freely, allowing flexible and precise searches.

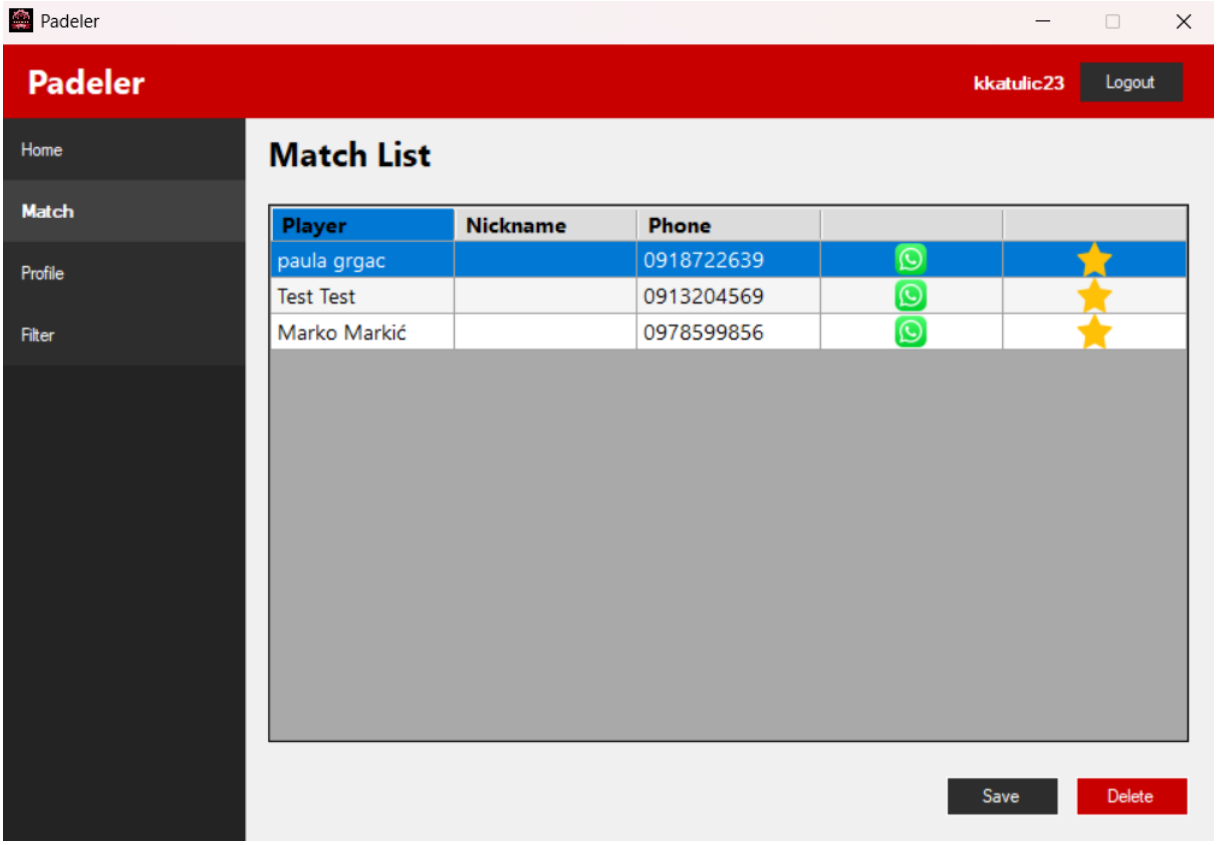
Applied filters are saved locally for the duration of the user session and automatically reset upon logout.



6. Matches and Interaction

When two users mutually like each other, a **match** is created. This indicates that both users are interested in playing together.

Matched users can be reviewed in a dedicated match list, which provides a clear overview of successful connections. This mechanism encourages meaningful interactions and avoids unwanted matches.



---

7. User Rating System

After matching with other users, players can rate each other using a numerical rating system. Ratings contribute to a user's overall score.

The rating system promotes fair play, reliability, and positive behavior within the Padeler community. Users with higher ratings are perceived as more trustworthy and experienced players.

---

8. Badges and Achievements

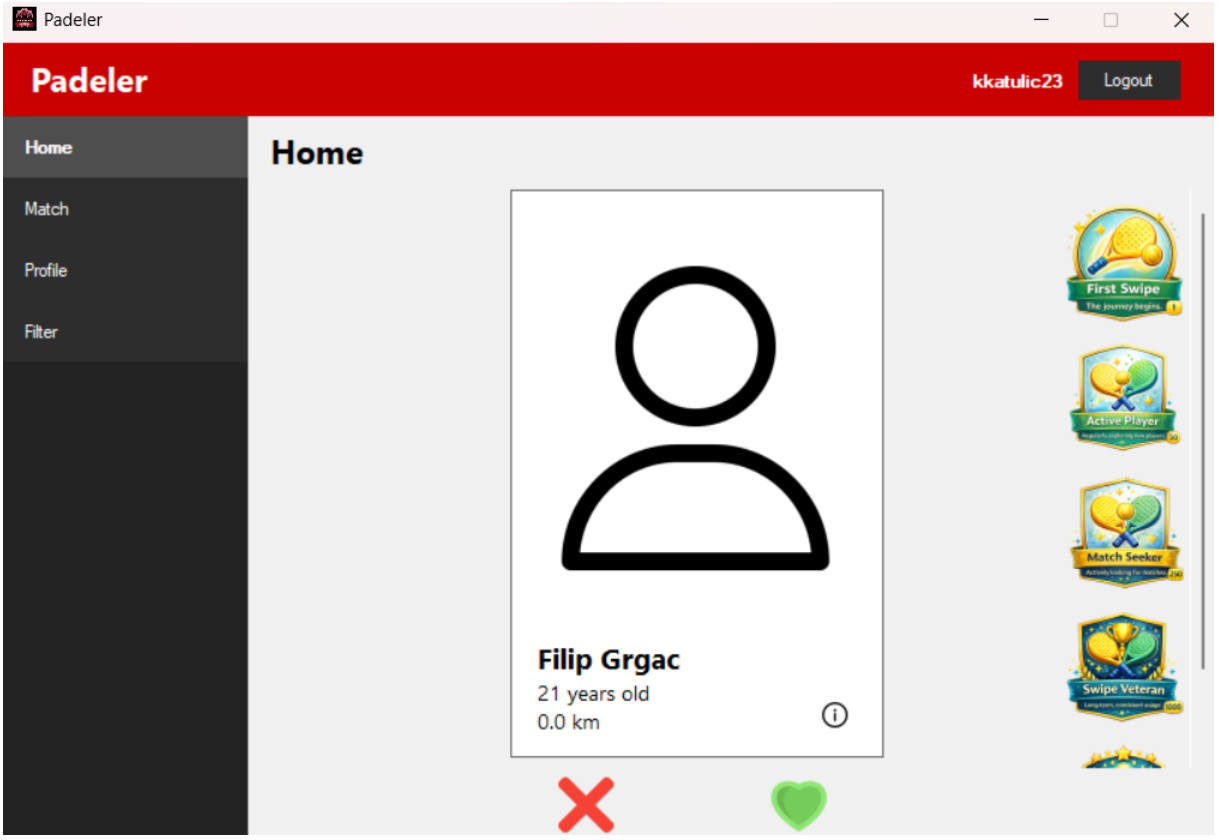
Padeler includes a badge system that rewards user activity and engagement. Badges are earned automatically based on usage milestones.

Available badges include:

- **First Swipe (1 point)**
  Awarded after the first swipe action.
  This badge marks the beginning of the user's journey.

- **Active Player (50 points)**
  Awarded for regular interaction with the app.
  Indicates consistent activity.
- **Match Seeker (250 points)**
  Awarded for actively searching and matching with other users.
  Highlights social engagement.
- **Swipe Veteran (1000 points)**
  Awarded for long-term, consistent usage.
  Represents dedication and experience.
- **Swipe Legend (2000 points)**
  Awarded for elite-level engagement.
  Reserved for the most active and committed users.

Badges are displayed in the user profile and serve as motivation for continued use of the application.



---

9. User Profile Management

The profile screen allows users to view and update their personal information.

Users can:

- Edit profile details
- Change their profile image

- Review earned badges
- View their current rating

Profile updates are saved immediately and reflected throughout the application.

---

10. Location Handling

Padeler uses the device's location services to determine the user's position. Location updates are handled asynchronously in the background to avoid blocking the user interface.

If the location is successfully updated while the Home screen is active, the displayed user cards are automatically refreshed. If the user navigates to another screen, no forced navigation occurs.

---

11. Logout and Session Handling

Users can log out using the logout button in the navigation menu. Upon logout:

- User session data is cleared
- Saved filters are reset

The application then returns to the login screen.

---

12. Frequently Asked Questions (FAQ)

Why are no users displayed?
Filters may be too restrictive, or no users are available within the selected radius.

Why is the distance shown as 0 km?
The user's location has not yet been determined.

Why do filters reset after logout?
Filters are session-based and cleared intentionally to ensure a clean state.

Can I use the application without enabling location services?
The application can be used without location access, but nearby users will not be displayed until a valid location is available. If there was location recorded before it will use that location.

How is the user rating calculated?
User ratings are calculated as an average of received ratings after interactions or matches. A higher rating indicates a more reliable and active player.

Do badges affect my ranking or visibility?
Badges are purely informational and motivational. They do not directly influence search results but indicate user engagement and experience.

Are my filters saved after closing the application?
Filters are saved only during the active user session. They are automatically reset when the user logs out to ensure a clean state for the next login.

---

13. Conclusion

Padeler provides a modern and efficient way for padel players to find suitable partners. Through location-based matching, customizable filters, a rating system, and gamified achievements, the application offers a complete and engaging user experience.
